- ☐ Questions

# Presentation Plan

---

- ❑ Introduction
- ❑ Best Practices for IP Protection
- ❑ Drafting Strategies
- ❑ Filing strategies
- ❑ Questions

# What is a Patent ?

**Sales Executive:** A patent is a business tool, that may be used to earn a lot of money. You can easily trade or license a technology using patents.

**Scientist:** A patent is a proof of one's intellectual creation. It gives you the right credit you deserve when you build a technology

**Patent Attorney:** A patent conveys the right to **exclude** others from: making, using, or selling the patented invention for the term of the patent.

- Rights
- Protection

- Public Disclosure
- State of the Art

A patent is a contract between a state and an entity

# Why do I need Patents?

---

- ❑ Patents gives you
  - Strategic position
  - Competitive advantage
  - Revenue stream through licensing
  - Greater valuation in case of M&A, raising VC funding etc.
- ❑ Your patents can earn you millions
  - CADTRAK had patent in graphics technology
  - Licensed out its patent to 400 companies, inc. IBM
  - 5 people, 2 computers, 1 patent - USD 50 million!!
- ❑ Lack of IP can cost you a fortune- Xerox lost over half a billion
  - In 1979, Xerox decided not to patent its invention on GUI
  - GUI formed the basis of Apple's Macintosh and Microsoft's Windows PC operating systems
  - At a conservative royalty rate of 1% of sales, Xerox lost US\$500 million during the lifetime of the patent

# Nanotechnology and Patents

---

- ❑ US Patent 4343993 on STM by Gerd Binnig and Heinrich Rohrer of IBM
- ❑ Nanoimprint lithography (NIL) invented by Prof Stephen Chou (US 5772905) gave rise to nanofabrication
- ❑ Carbon nanotubes at NEC by Sumio Iijima (US 5747161) and at IBM by Bethune et al., (US 5424054)
- ❑ Quantum dot technology by Paul Alivisatos, at Berkeley (US 5505928) and Moungi Bawendi (US 6322901) at MIT

# Presentation Plan

- ☐ Introduction
- ☐ **Best Practices for IP Protection**
- ☐ Drafting Strategies
- ☐ Filing strategies
- ☐ Questions

# Document, document, document

---

- ❑ Regularly maintain well-documented and dated laboratory records during the research process
  - ❑ Should be written in ink, in numbered pages bound notebook
  - ❑ Avoid using miscellaneous scraps of paper
  - ❑ Get it witnessed and signed by a colleague not involved in the discovery
  - ❑ Document the detailed information including the date to date detail, right from conceptualization of a new idea, experiments and the results

# Avoid Premature Disclosure

---

- ❑ Avoid any form of disclosure which could compromise the patentability of the invention
- ❑ Not possible to patent in UK or Europe after the invention is offered for sale or publicly displayed
- ❑ One year grace period in US- not possible to file for a patent one year after the offer for sale or public disclosure

# Perform background work

---

- ❑ Identify and assess the commercial potential of the research being undertaken as early as possible
- ❑ Check for IP Contractual agreements existing between employer and employee with regard to ownership of invention, sharing of benefits, and keeping confidentiality of the know-how and other scientific and technical information

# Presentation Plan

- ☐ Filing strategies
- ☐ Questions

# Parts of a patent application

---

- ☐ Background
- ☐ Drawings
- ☐ Detailed Description
- ☐ Claims
- ☐ Summary
- ☐ Abstract

# What are Claims

---

- ❑ Claims provide the precise legal definition of the invention
- ❑ Define the boundary of the protected space claimed by the invention
- ❑ The grant or rejection of a patent depends largely on the claims of the patent

# How should Claims be drafted

- ❑ Identify the technological landscape
- ❑ Perform a prior art search
- ❑ Analyze the prior art to identify 'free space'
- ❑ Draft claims so as to cover maximum free space

# Drafting Strategies

---

- ❑ Prior Art:
  - ❑ Disclose the relevant preexisting technology
  - ❑ Make sure to look for prior art in different industries
  - ❑ Do not disparage any prior art in the application
- ❑ Detailed Specification:
  - ❑ Disclose as much as possible for enablement
  - ❑ Always Disclose the Best Mode of the invention
- ❑ Claims:
  - ❑ Always include claims of varying scope
  - ❑ Make sure to capture interdisciplinary scope
  - ❑ Seek professional help

# Presentation Plan

---

- ☐ Introduction
- ☐ Best Practices for IP Protection
- ☐ Drafting Strategies
- ☐ **Filing strategies**
- ☐ Questions

# Filing Strategies

---

- ❑ Assess the commercial potential of the research and perform a cost benefit analysis
- ❑ Define filing geographies early on
- ❑ Understand the objective behind filing and decide on the filing strategy based on the objective

# Provisional Patent Application (PPA)

---

- ❑ To establish an early filing date for the invention that may later be claimed as a "priority" date in a later-filed regular or foreign patent application
- ❑ No formal requirements for the written description or sketches and no examination
- ❑ Useful for highly competitive technology fields and for meeting bar date requirements

# Regular Patent Application (RPA )

---

- ❑ May take 1-2 months for drafting and filing of a regular patent application
- ❑ Allows the inventor to mark the invention "Patent Pending"

# Foreign Application

---

- ❑ To gain patent protection in a geography of interest
- ❑ Multiple separate applications or PCT application
- ❑ Useful for innovations that are commercially very attractive and should therefore be exploited globally

# Defensive Publication– Alternative to Patents

---

- ❑ IP strategy to prevent a competitor from obtaining a patent on a patentable product or method
- ❑ Disclose an enabling description and drawings of the product so it enters public domain and becomes prior art
- ❑ Useful for innovations that do not warrant the high costs incurred in patent applications but to which scientists do want to retain access
